VIZWELL MORE THAN QUALITY

This is our goal: not only to provide high quality products, but also offer the most comprehensive service.

Quality is the main point: all our garments are hard-wearing and functional, but also stylish and comfortable. Top grade fabric is used in each garment to ensure the higher performances. Before the garment is finished, it passes through an extensive quality check: fabric and other components are always checked once they arrive at our factory and again before they are put into production. The finished garment is inspected right in production lines and before it is put in our warehouse or sent out to our customers.

Our entire professional range is **EN certified**.

Stock availability is what we offer to our customers to ensure a quick service and avoid long lead time. All cartons have barcodes which allow an automatic scan at our warehouse and also for you at your premises. You can check quantity that are usually kept on stock by yourself.

Customer service is one of our strength. Once you have placed your order with our professional team, you will no longer have to worry about the details on the order progressing. Our highly experienced staff will take care everything for you.

All our garments are Vizwell branded. We also provide some **product customization** services, such as logo embroidery or printing, as you wish.

We always put great effort on product development: unique and innovative **New products** are always added to our already robust product line. Beside the great choice of High Visibility Jackets, including Flame Retardant, 5 in1, Bomber and Parka Jackets, check out our Safety Vests, Shirts, Rain set, Softshell and Fleece collections. We also have an extensive line of Polycotton garments and Accessories, all suitable for workers in hazardous situations with any light conditions.

This is **Vizwell**, this is how we work and what we consistently offer:
More than quality.

Standards Guide

EN13688

EN ISO 13688 - Protective Clothing – General Requirements

This European Standard specifies general requirements for ergonomics, ageing, sizing and marking of protective clothing, and for information supplied by the manufacturer. This standard replaces the old EN340 standard.

EN ISO 20471:2013+A1:2016

This is the harmonized European standard for high visibility clothing. It specifies the requirements for signaling the users presence day or night. High visibility clothing is grouped into three classes related to risk assessment. The performance class can be obtained using a single garment or a clothing ensemble, e.g. jacket and trousers.

CLASS 3 :Highest level

-Minimum background material 0.80m²

-Minimum retro-reflective material 0.2m²

CLASS 2: Medium level

-Minimum background material 0.50m²

-Minimum retro-reflective material 0.13m²

CLASS 1: Lowest level

-Minimum background material 0.14m²

-Minimum retro-reflective material 0.1m²

RIS-3279-TOM

RIS-3279-TOM

The RIS-3279-TOM standard is based on the European standard EN 471:2003. It requires garments to meet at least class 2 (the mid-point of a 3-class scale) of EN 471 for the minimum area of high visibility materials used within a garment. Whereas the European standard permits several different colours of high visibility materials, the railway standard specifies an orange colour.

EN 342:2017

This European Standard is published to achieve a common basis in Europe for requirements and test methods for protective clothing ensembles and garments against cold in the interest of especially manufacturers, test institutes and end-users. The measured properties and their subsequent classification are intended to ensure an adequate protection level under different user conditions. Thermal insulation of the ensemble or garment and the air permeability are the essential properties to be tested and marked on the label.

EN343:2003+A1:2007

This European standard concerns protective clothing against rain, wind and cold at temperatures higher than -5°C. This standard specifies the requirements and test methods applied to the materials and seams of the protective clothing against the effects of foul weather (for example, rain or snow), fog and humidity. The requirements of the EN343 include:

X: Water resistance

Y: Moisture, vapour and perspiration or "breathability" of the garment

Strength of garment components-tensile, tear, seam strength and shrinkage

EN 14058:2017

The garment meet this standard can provide a certain degree of protection to cool for a certain length of time, depending e.g. on personal constitution and activity, the accompanying clothing and the environmental features (wind speed, temperature, humidity).

EN1150

EN1150:1999

This standard is for non-professional high visibility clothing. For example, jogging, cycling or other traffic related interaction activities.

EN13356

EN 13356:2001

This standard specifies the optical performance requirements and surface area requirements for accessories intended for non-professional use, and intended to signal the user's presence visually when illuminated by vehicles on dark roads. The accessories can be worn, attached to or carried by persons.

**EN 1149-5:2018**

This is the standard specifies the performance and requirement for anti-static for materials and protective clothing. It covers clothing used as part of an earthed system, to avoid incendiary discharge of static electricity. The requirements may not be sufficient in oxygen enriched flammable atmospheres. This standard is not applicable for protection against mains voltages.

EN 61482-1-2

**IEC61482-2:2018**

IEC 61482 Protective clothing against the thermal hazards of an electric arc.

EN61482=Arc in the box test method

Class 1=4ka

Class 2=7ka

EN61482=Open Arc test method

ATPV(Arc Thermal Performance Value) cal/cm²

**EN ISO14116:2015**

The standard specifies the performance requirements for the limited flame spread properties of materials, material assemblies and protective clothing in order to reduce the possibility of the clothing burning and therefore avoiding a hazard. Additional requirements for clothing are also specified.

Features:

Index 1 (flame spread, flaming debris and afterglow properties)

Index 2 (as index 1 plus hole formation properties)

Index 3 (as index 2 plus afterflame properties)

**EN ISO11611:2015**

This international standard specifies minimum basic safety requirement and test methods for protective clothing for use in welding and allied processes (exclude hand protection). Class 1 is against less hazardous welding techniques and situations, causing lower levels of spatter and radiant heat. Class 2 is against more hazardous welding techniques and situations, causing higher levels of spatter and radiant heat.

**EN ISO11612:2015**

Protective clothing to protect against heat and flame. This standard is describing minimum requirements for industrial workers exposed to heat. This means short contact with flame and with at least one type of heat (convective, radiant, large molten metal splashes or a combination of these). This Standard also defines some minimum parameters that the fabrics have to comply with: Tear resistance, tear strength, burst strength and seam strength.

**EN 13034:2005+A1:2009**

Performance requirements for the chemical protective clothing offering limited protective performance against liquid chemicals. This standard specifies the minimum requirements for limited use and re-usable limited performance chemical protective clothing.
